The City has completed the new Clarifier and Ultra Violet Light disinfection project. The project started in September, 2007 and was completed in April, 2008. This ensures the uninterrupted supply of safe drinking water to the public.

We are pleased to present to you this year's Annual Quality Water Report. In accordance with the Safe Drinking Water Act, this report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We are committed to ensuring the quality of your water, and want you to understand the efforts we make to continually improve the water treatment process and protect our water resources.

The City of Bandon uses water from two sources, Ferry Creek and Geiger Creek. During 2010 we treated 200 million gallons of water.

Water treatment is the process of cleaning the water. The City of Bandon’s Water Treatment Plant uses a four-step process to treat the water. In the first step alum (aluminum sulfate) is added to the untreated water to make particles like dirt, sediment and other substances in the water coagulate, or stick together. These particles clump together into larger particles called “floc” In the second step, the water enters the settling tank, or sedimentation basin. The floc particles are heavier than water so they settle to the bottom of the tank. During the third step, the water flows through the sand and charcoal filters. In the final step, chlorine is added to the water to kill any germs and to keep it safe in the distribution system as it travels to your tap. With the new plant on line the City has installed a chlorine generator which produces our own chlorine on site and it is not classified as a hazardous material.

The City of Bandon routinely monitors for components in your drinking water according to Federal and State laws. The following table in this report shows the results of our monitoring for the period of January 1 to December 31, 2010. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some components. It's important to remember that the presence of these components does not necessarily pose a health risk.

In the table, you will find many terms and abbreviations you might not be familiar with. To help you better understand those terms we are providing the following definitions:

- **Non-Detects (ND)** - laboratory analysis indicates that the component is not present.
- **Parts per million (ppm) or Milligrams per liter (mg/l)** - one part per million corresponds to one minute in two years or a single penny in $10,000.
- **Parts per billion (ppb) or Micrograms per liter** - one part per billion corresponds to one minute in 2,000 years, or a single penny in $10,000,000.
- **Parts per trillion (ppt) or Nanograms per liter (nanograms/l)** - one part per trillion corresponds to one minute in 2,000,000 years or one penny in $10,000,000,000,000.
- **Parts per quadrillion (ppq) or Picograms per liter (picograms/l)** - one part per quadrillion corresponds to one minute in 2,000,000,000 years or one penny in $10,000,000,000,000,000.
- **Picocuries per liter (pCi/L)** - picocuries per liter is a measure of the radioactivity in water.
- **Millirems per year (mrem/yr)** - measure of radiation absorbed by the body.
- **Million Fibers per Liter (MFL)** - million fibers per liter is a measure of the presence of asbestos fibers that are longer than 10 micrometers.
- **Nephelometric Turbidity Unit (NTU)** - nephelometric turbidity unit is a measure of the clarity of water. Turbidity in excess of 5 NTU, will appear as just enough cloudiness to be noticeable to the average person.
- **Action Level** - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.
- **Turbidity Level** - a required process intended to reduce the level of a contaminant in drinking water.
- **Maximum Contaminant Level** - The “Maximum Allowed” (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
- **Maximum Contaminant Level Goal** - The “Goal”(MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
The City of Bandon tests its water for a total of 91 compounds. No contaminants were found, except insignificant amounts of a few items, as shown in the table below. As you can see, our system had no violations. We’re proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some components have been detected. The EPA has determined that your water IS SAFE at these levels. All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency’s Safe Drinking Water Hotline at (1-800-426-4791). Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

### Radioactive Contaminants

Tests Results are from September 2002. They are required every 6 years.

### Lead and Copper Testing - Test are from 2009. They are Required every 3 years.

### DISINFECTION BYPRODUCTS

1. **Turbidity**: Turbidity has no health effects. However, turbidity can interfere with disinfection and provide a medium for microbial growth. Turbidity may indicate the presence of disease-causing organisms. These organisms include bacteria, viruses, and parasites that can cause symptoms such as nausea, cramps, diarrhea, and associated headaches.

2. **Radioactive Contaminants**: Alpha emitters. Certain minerals are radioactive and may emit a form of radiation known as alpha radiation. Some people who drink water containing alpha emitters in excess of the MCL over many years may have an increased risk of getting cancer.

3. **Copper**: Copper is an essential nutrient, but some people who drink water containing copper in excess of the action level, over a relatively short amount of time, could experience gastrointestinal distress. Some people who drink water containing copper in excess of the action level, over many years, could suffer liver or kidney damage. People with Wilson's Disease should consult their personal doctor.

4. **Lead**: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. It is possible that lead levels at your home may be higher than at other homes in the community as a result of materials used in your home’s plumbing. The City of Bandon is responsible for providing high quality drinking water, but cannot control the associated headaches.

5. **Contaminant Violation Y/N**, **Level Detected**, **MCLG**, **MCL**, **Likely Source of Contamination**

### WATER QUALITY TEST RESULTS

The City of Bandon tests its water for a total of 91 compounds. No contaminants were found, except insignificant amounts of a few items, as shown in the table below. As you can see, our system had no violations. We’re proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some components have been detected. The EPA has determined that your water IS SAFE at these levels. All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency’s Safe Drinking Water Hotline at (1-800-426-4791). Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

A source water assessment has been completed by the Department of Environmental Quality and is available at City Hall. The primary intent of this source water assessment is to provide the background information for the community to use in developing a local Drinking Water Protection Plan. The susceptibility of the public drinking water system depends on both the natural conditions as well as the land use and facilities operating in the watershed. If you have any questions about this report, or concerning your water utility, please contact Gene Davidson, Water Treatment Plant Operator, at 541-347-3607 or Matt Winkel, City Manager, at 541-347-2437 ext. 229 (e-mail – citymanager@ci.bandon.or.us). We want our valued customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled City Council meetings. They are held on the first Monday of every month at 7:00 PM in the City Council Chambers at City Hall.
